```
 <bean id="唯一标识符" class="全限内定名">
   property name="list1">
      <1ist>
        //注入bean引用
        //<ref bean/>
        <value>a</value>
        <value></value>
        <value></value>
      \langle /1 ist \rangle
   property name="array1">
      <array>
        <value></value>
        <value></value>
        <value></value>
      </array>
   property name="set1">
      <set>
        <value></value>
        <value></value>
        <value></value>
      </set>
   property name="map1">
      <map>
        <entry>
```

```
<key>
                 <value></value>
              </key>
              <value></value>
           </entry>
           <entry>
              <key>
                 <value></value>
              </key>
              <value></value>
           </entry>
            //<entry key="one" value="INDIA"/>
                   //<entry key ="two" value-
ref="address1"/>
                   //<entry key ="three" value-
ref="address2"/>
        </map>
     property name="props1">
        props>
//名称和值都是字符串类型
           prop key=" ">s</prop>
            prop key=" ">a</prop>
           prop key=" ">s</prop>
        </bean>
```

不管在property中,还是constructor-arg中,一样赋值。
